

Prerequisites

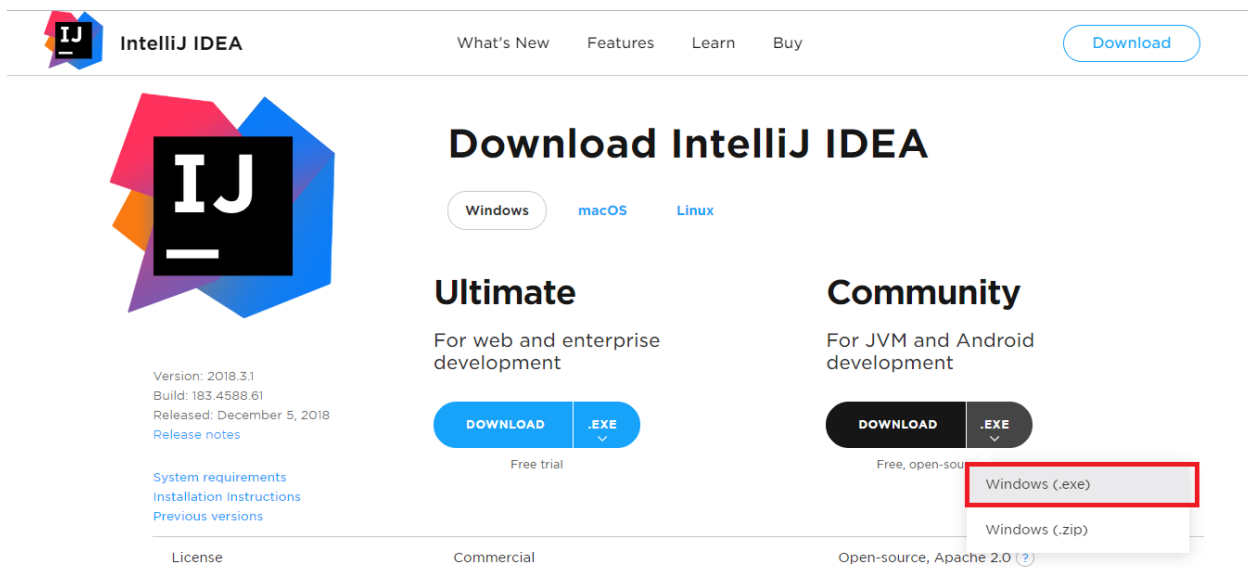

- IntelliJ setup installed.
- JDK installed.
- chromedriver.exe (if you don't have Mozilla Firefox installed on your computer. Only .exe is required – don't need to install it)

Download link for chromedriver.exe:

<http://chromedriver.storage.googleapis.com/index.html?path=2.9/>

IntelliJ Installation

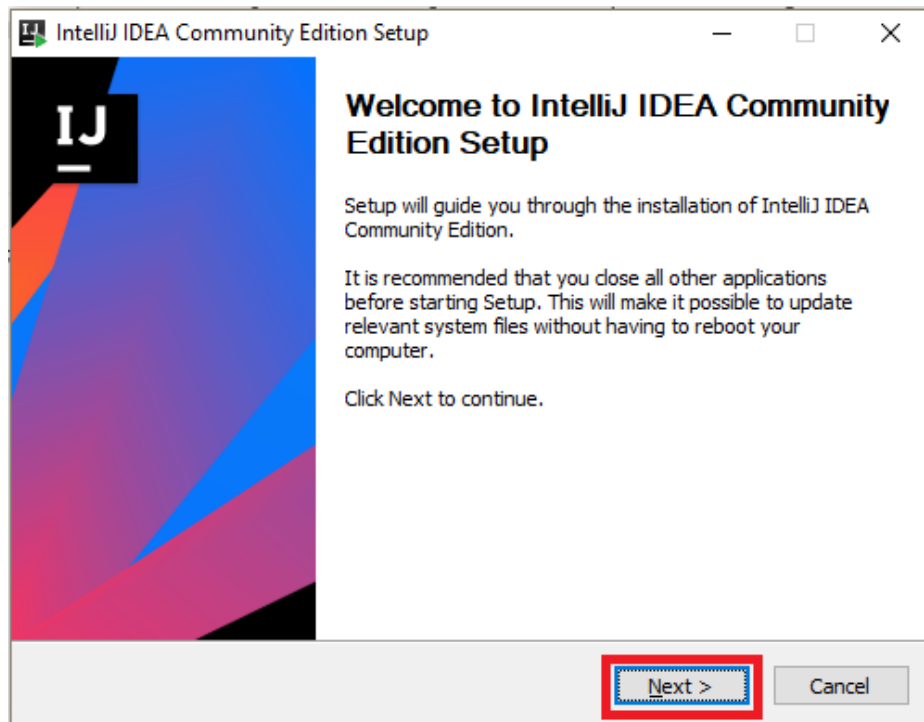

Go to the website <https://www.jetbrains.com/idea/download/#section=windows> and download the setup.

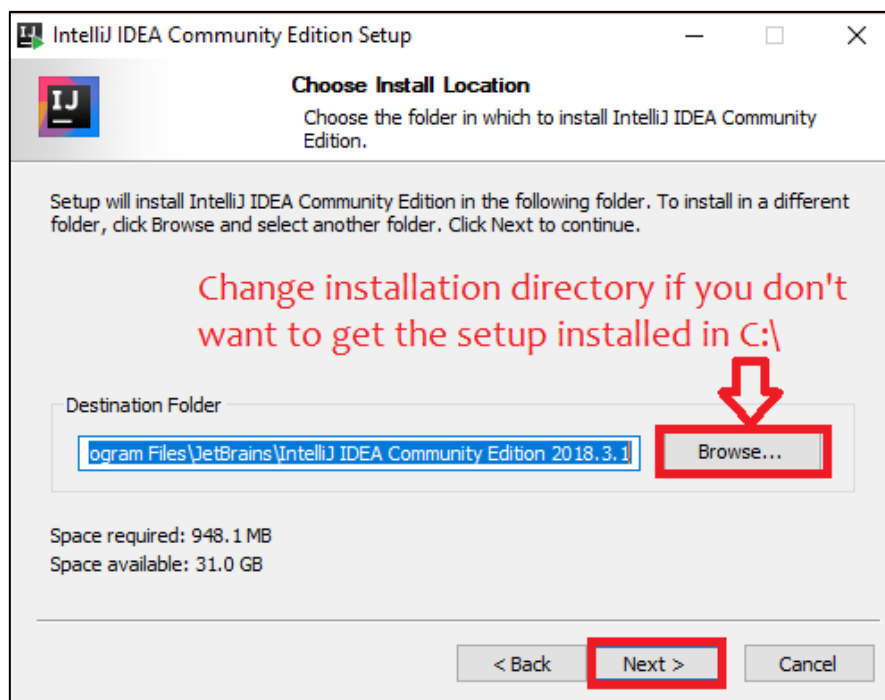

After downloading the setup double click ***ideaIC-2018.3.1.exe***. Your setup will get initiated.

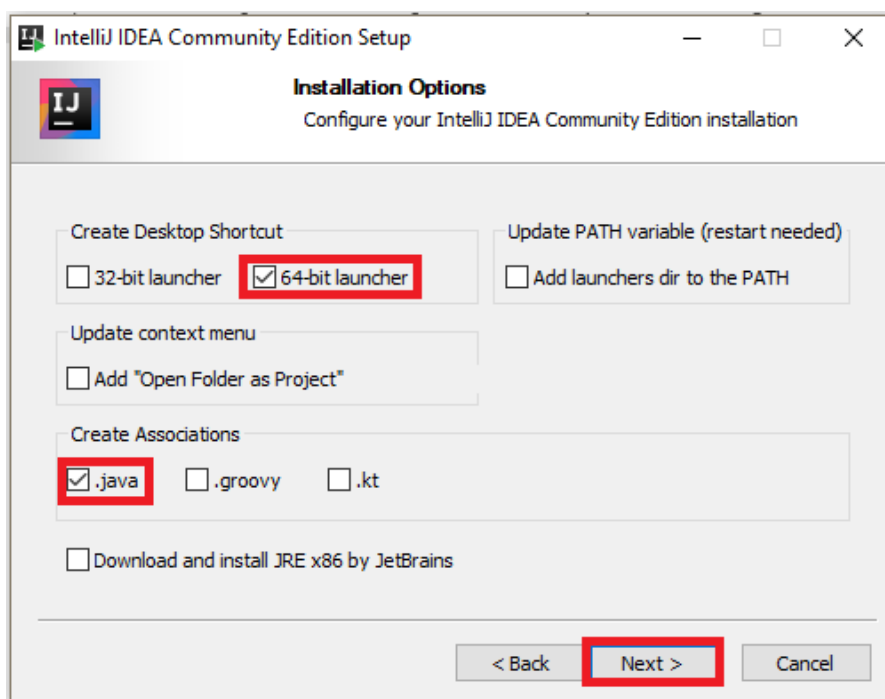

1. Click ***Next***.

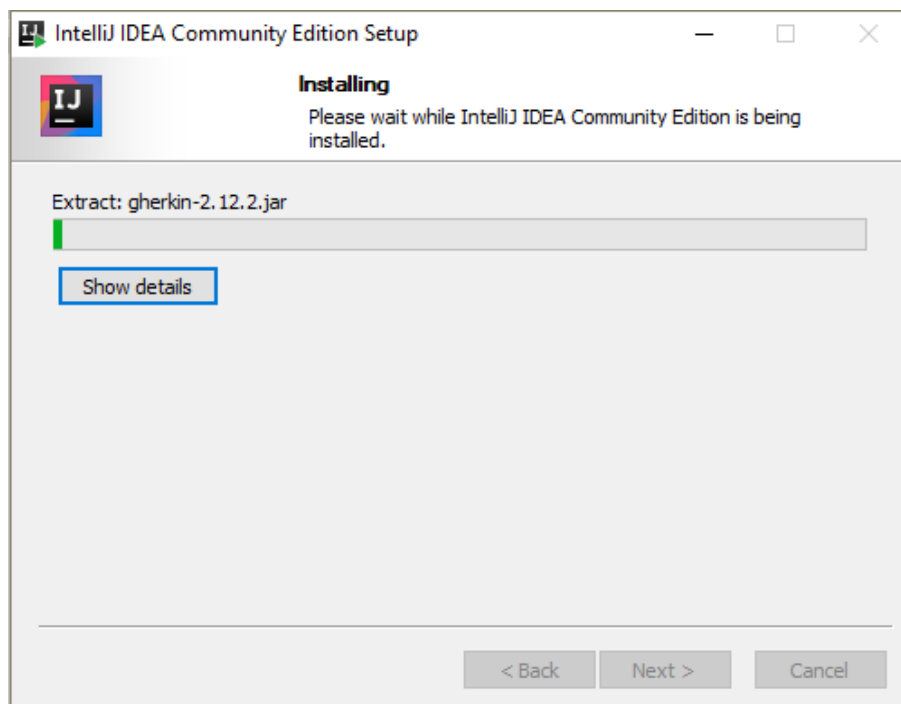

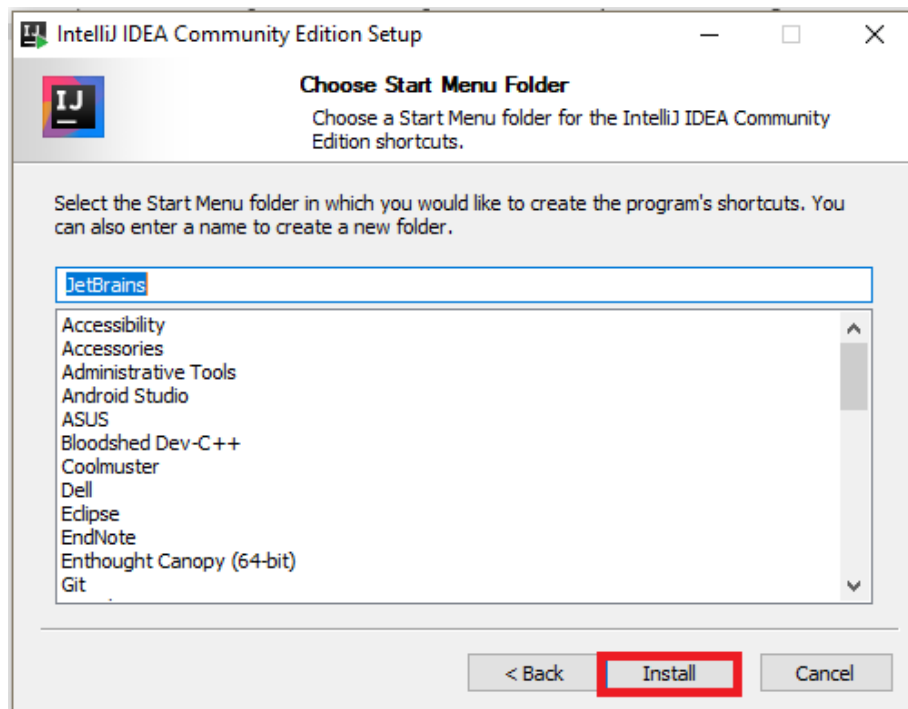

2. Change the installation directory if you want to by going to **Browse** and click **Next**.

3. Select your system as of **64-bit or 32-bit** as per your system properties.
4. Select **.java** from Create Associations section.
5. Click **Next**.

6. Click **Install**.

7. Select **Run IntelliJ IDEA Community Edition**.
8. Click **Finish**.

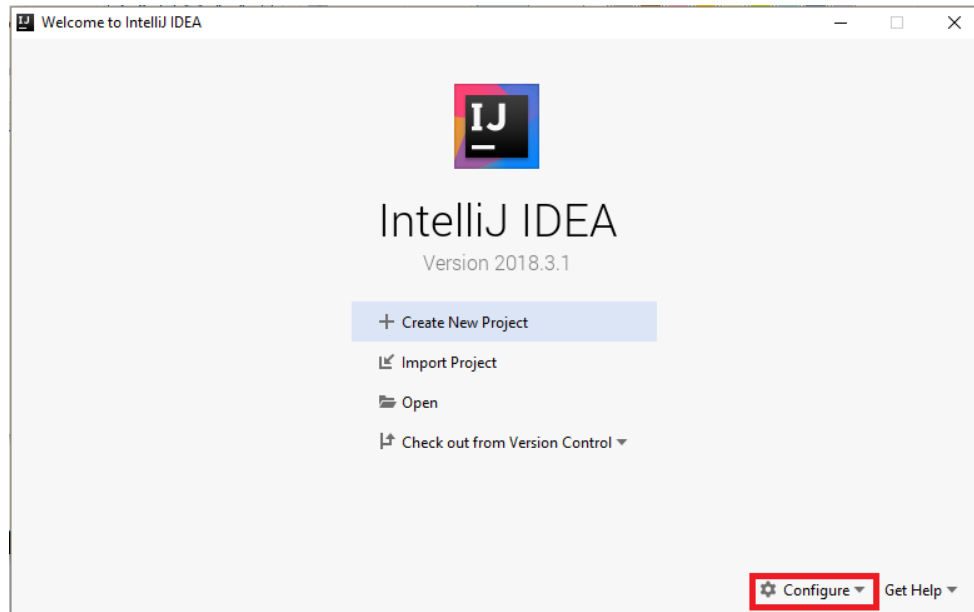

- After your setup opens for the very first time it asks to import settings – Select **Do not import settings** and click **OK**.

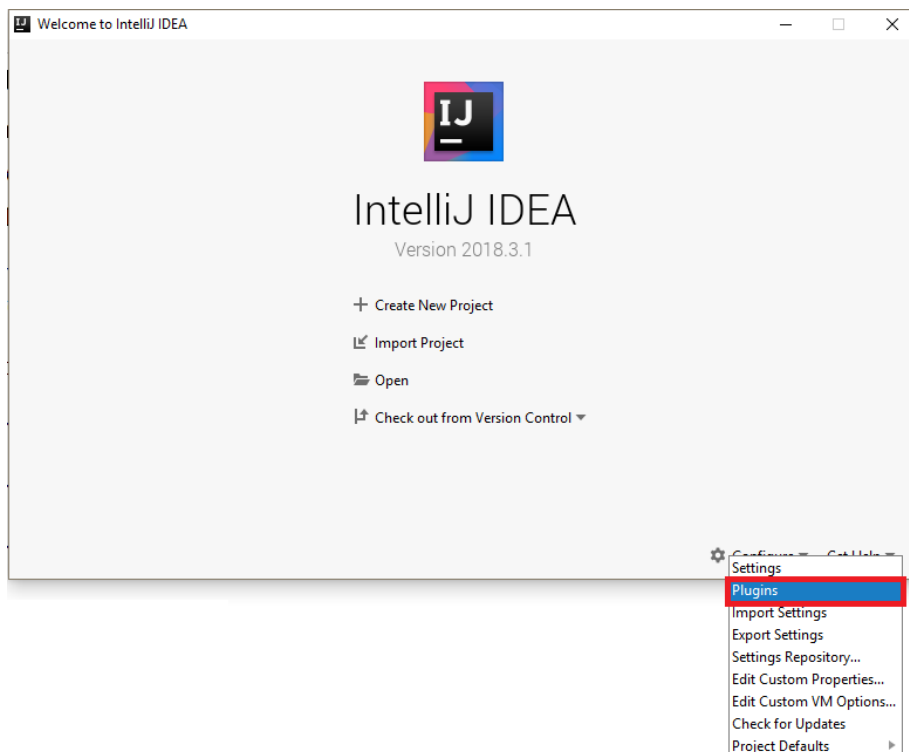

Installing Selenium Plugin

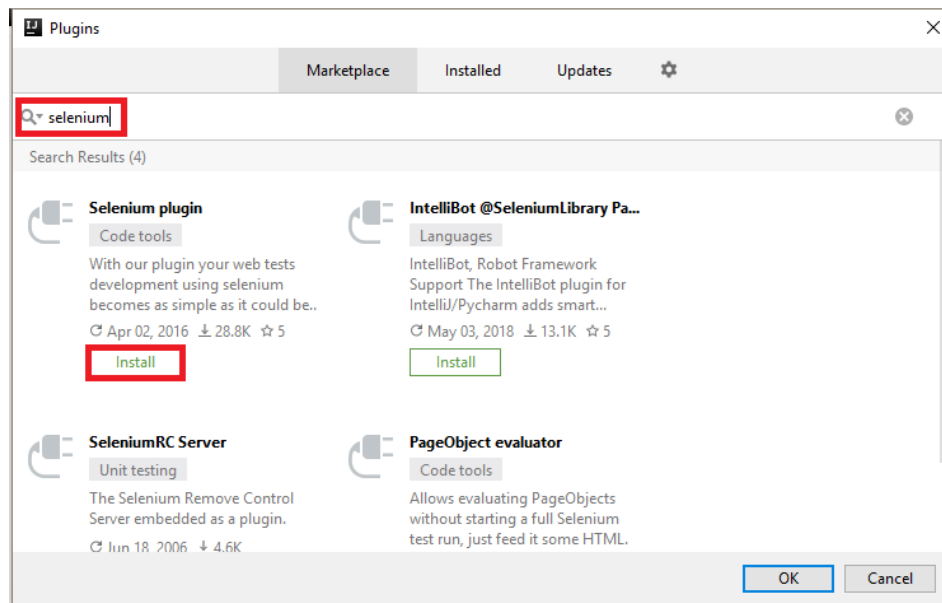

1. Click *Configure*.

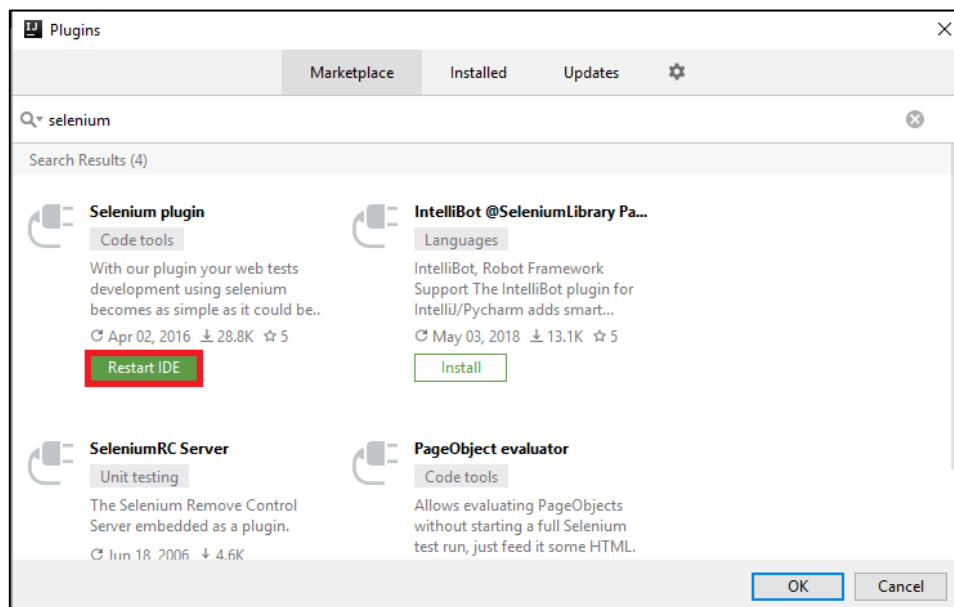

2. Select *Plugin*

3. Search for *selenium* in the search bar.
4. Install *Selenium Plugin*.

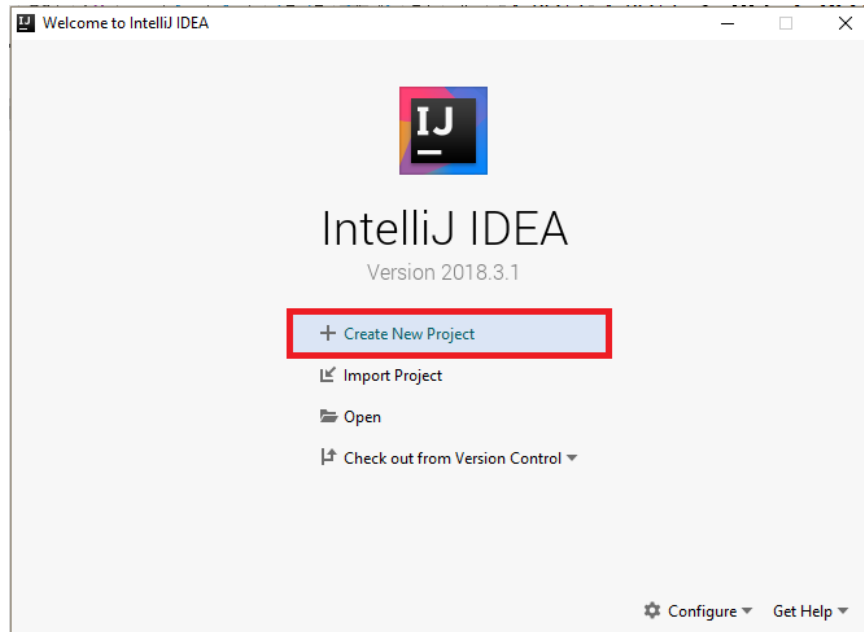

5. *Restart IDE.*

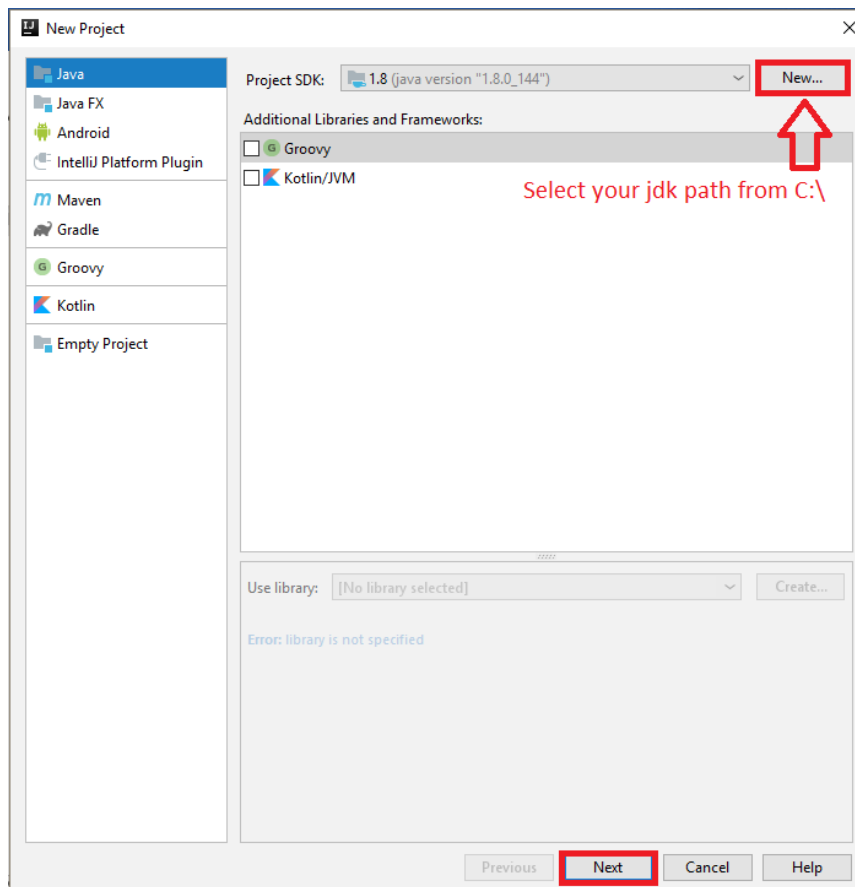

Getting started with Selenium WebDriver with Junit

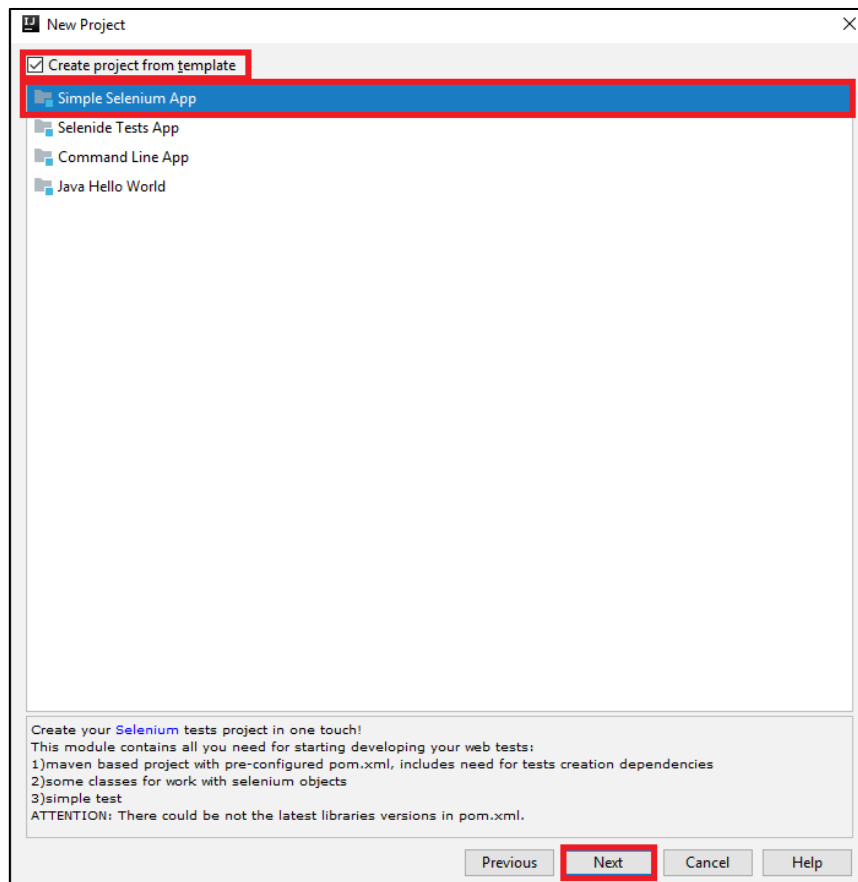

1. Create a New Project.

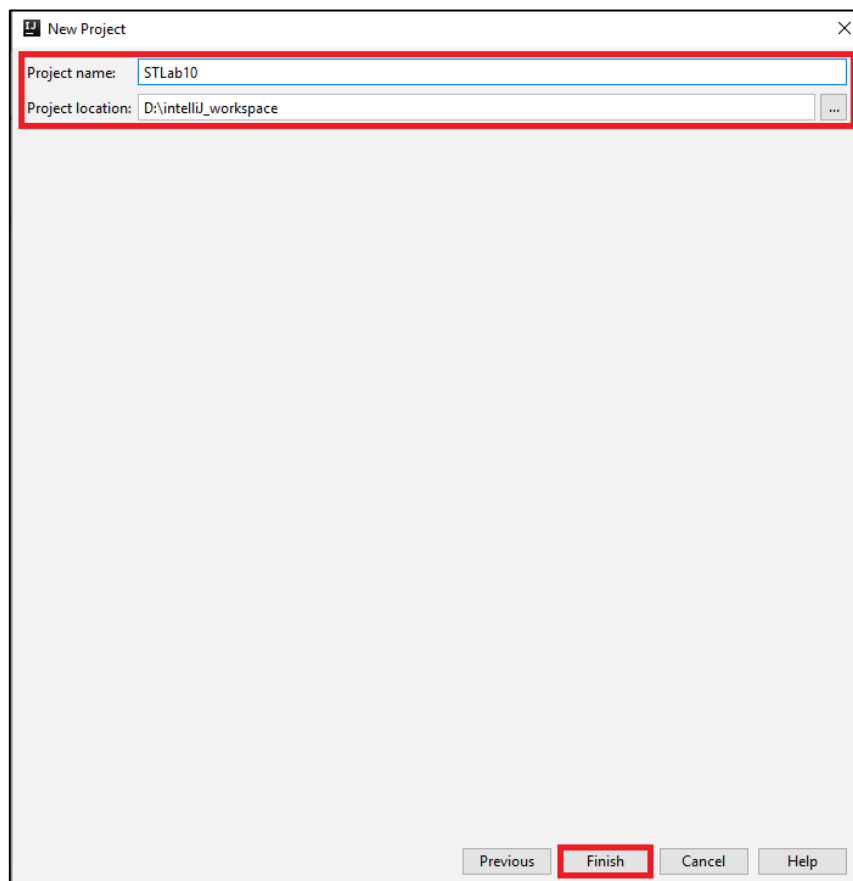

2. Select the path to your jdk from C:\

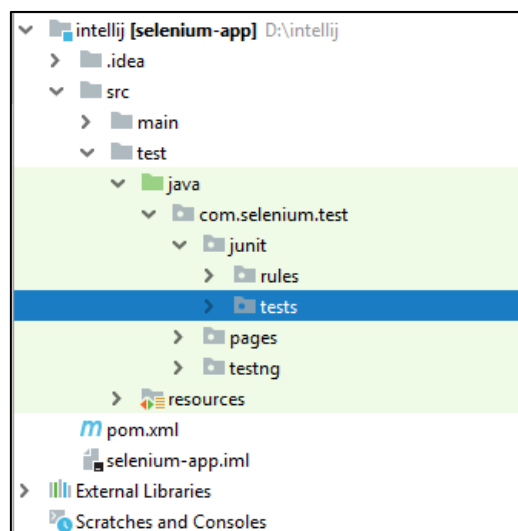

3. Check the option *Create project from template*
4. Select template *Simple Selenium App*

5. Name your project and select its directory.
6. Click *Finish*.

7. Your project will be created in the Project View navigate to:
 (workspace name)\src\test\java\com.selenium.test\junit\tests
 and **right click on tests**.

8. Select **New > Java Class**
 9. Name your class as **TestExample1** and click **OK**.
 10. In it create three functions as:

```
@Before
public void setUp() {

}

@After
public void tearDown() {
```

```

}

@Test
public void testExamples() {
    // We will put examples in here
}

```

In the setup() function write the code to be tested so that the setup() will be as:

```

@Before
public void setUp() throws MalformedURLException {
    System.setProperty("webdriver.chrome.driver",
        "E:\\chromedriver_win32\\chromedriver.exe");
    WebDriver driver = new ChromeDriver();
    driver.get("http://www.theautomatedtester.co.uk/demo2.html");
    WebElement someElement =
        driver.findElement(By.className("draggable"));
    WebElement otherElement =
        driver.findElement(By.className("droppable"));
    Actions builder = new Actions(driver);
    Action dragAndDrop = builder.clickAndHold(someElement)
        .moveToElement(otherElement)
        .release(otherElement)
        .build();
    dragAndDrop.perform();
}

```

You have to give the path to chromedriver.exe where you have placed it in your computer in the first line of setup():

```

System.setProperty("webdriver.chrome.driver",
    "E:\\chromedriver_win32\\chromedriver.exe");

```

Note: If you are using it with Mozilla Firefox replace

```

System.setProperty("webdriver.chrome.driver",
    "E:\\chromedriver_win32\\chromedriver.exe");
WebDriver driver = new ChromeDriver();

```

with

```

WebDriver driver = new FirefoxDriver();

```

11. Press **Alt+Enter** to import the required libraries so that your complete test class will be as:

```

package com.selenium.test.junit.tests;

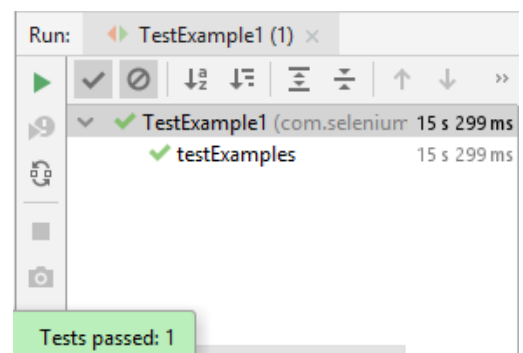

import org.junit.After;
import org.junit.Before;
import org.junit.Test;
import org.openqa.selenium.By;
import org.openqa.selenium.Platform;
import org.openqa.selenium.WebDriver;
import org.openqa.selenium.WebElement;
import org.openqa.selenium.chrome.ChromeDriver;
import org.openqa.selenium.firefox.FirefoxDriver;
import org.openqa.selenium.interactions.Action;
import org.openqa.selenium.interactions.Actions;
import org.openqa.selenium.remote.DesiredCapabilities;
import org.openqa.selenium.remote.RemoteWebDriver;

import java.net.MalformedURLException;
import java.net.URL;

public class TestExample1 {

    @Before
    public void setUp() throws

```

```

MalformedURLException {
    System.setProperty("webdriver.chrome.driver",
        "E:\\chromedriver_win32\\chromedriver.exe");
    WebDriver driver = new ChromeDriver();
    driver.get("http://www.theautomatedtester.co.uk/demo2.html");
    WebElement someElement =
        driver.findElement(By.className("draggable"));
    WebElement otherElement =
        driver.findElement(By.className("undropped"));
    Actions builder = new Actions(driver);
    Action dragAndDrop = builder.clickAndHold(someElement)
        .moveToElement(otherElement)
        .release(otherElement)
        .build();
    dragAndDrop.perform();
}

@After
public void tearDown() {
}

@Test
public void testExamples() {
    // We will put examples in here
}
}

```

12. **Right click *TestExample1*** in the Project View and run the test by selecting **Run ‘TestExample1’**. You’ll see that the test will pass if there are no bugs found.
